1. What is umsCodeGenerator (and tableTools) ?

umsCodeGenerator (and tableTools) is one of mappingSchema processors. We, UMS group, are developing the processor by ourselves in the course of defining the grammar system of [mappingSchema](#) (/index.html) . The grammar of mappingSchema has grown up with the evolution of these tools. Both grammar and these tools become simpler and more general.

These mappingSchema processors generate a source code from a **mapping definition**. At this moment, there are two tools umsCodeGenerator and tableTools with different capability. Version 0.4 of umsCodeGenerator will integrate major functions of both tools and be unified version. Brief History of development of mappingSchema processor by UMS group is given in a next section.
